COVID Testing in Wastewater

The Challenge
Community spread of COVID is difficult to control because symptoms can take up to 2 weeks to appear after contracting the virus. Making this even more challenging is that fact that many cases remain asymptomatic. Since individual testing is not a viable option, communities, including universities, are searching for a more proactive approach to identify trends for early infection.

Wastewater Monitoring

- Testing COVID in wastewater has shown to be an effective tool for pro-actively minimizing community spread.
- COVID has been detected in stool days before symptoms arise.
- Universities and municipalities are beginning to embrace this approach to identify hot spots within the community.
- Multiple success stories have been documented where wastewater surveillance in dorms, followed by individual COVID testing, has led to early detection and containment.

- University of Arizona, University of Virginia, Utah State University, and University of Colorado were among the first to utilize COVID trends within the wastewater and take action to minimize community spread within dorms and throughout campus.
Cost-Effective, Scalable Solution

- Monitoring wastewater has helped identify COVID early
  - Early virus stool shedding + efficient sample collection + rapid test method allows tracking changes in days vs. weeks
  - Includes information from asymptomatic and symptomatic individuals
  - Approximately 75-80% of US population connected to sewer system

- Provides actionable insights that compliment existing COVID management strategies
- Cost effective and scalable at the community level compared to relying exclusively on individual testing
- Allows targeting of high-risk locations: **Universities/Dorms ● Public Schools ● Prisons ● Nursing Homes**

The Foundation for Your COVID Wastewater Monitoring Program

Representative samples are key to an effective COVID wastewater monitoring program. Hach® compact portable samplers enable automated composite wastewater sample collection and can be deployed throughout communities; helping to prevent an outbreak when combined with laboratory testing.

- **Intuitive interface with a large full color display makes setup and installation easy—preventing errors**
- **Rugged and reliable pump minimizes maintenance requirements**
- **Compact base for smaller manhole applications**
